Platform Sprint 6 Bug Report

1. When I attempt to make a commit without having been assigned to any milestones, the commit attempt fails with no constructive error.

2. When I attempt to commit to a milestone for which there are no tasks, there is an error: "NameError: global name 'exit' is not defined".

3. When I attempt to make a commit to a new milestone in a project in which you have already made commits to a different milestone, the commit fails. It has an error due to the defaults when there are not matching tasks in the new milestone.

4. It appears that the status field for a task is not being updated after a commit. If the task is created with a status of "New" and then a commit is made and a different status, such as "Implementation" is selected, this status change is not reflected in the firebase.
